## BioRECO<sub>2</sub>VER: turning CO<sub>2</sub> into chemicals using bioconversion

Within the European Horizon 2020 project BioRECO<sub>2</sub>VER, an international consortium will take an important step in making bioconversion of CO<sub>2</sub> commercially feasible. The 4-year project, coordinated by VITO, kicked off in January 2018 and will focus on refining biotechnological processes which can turn CO<sub>2</sub> from industrial point sources into valuable platform chemicals like lactate and isobutene. The impact of the BioRECO<sub>2</sub>VER project is to provide an important next step in valorizing CO<sub>2</sub>, while at the same time offering alternative solutions for the production of chemicals.

The project goal is to create alternative processes for commercial-scale production of platform chemicals in a more sustainable way starting from industrial emissions of CO<sub>2</sub>. However, we still need to overcome some technical and economic barriers, from which biotechnological processes for CO<sub>2</sub> conversion suffer. To name a few: gas pretreatment costs are still too high, gas transfer in the bioreactors is suboptimal, product recovery costs are still too elevated, and the scalability has not sufficiently been proven.

### BioRECO<sub>2</sub>VER will resolve remaining barriers

In the new European Horizon 2020 project BioRECO<sub>2</sub>VER, a team of specialized industrial, academic and research partners will look into solving these challenges. BioRECO<sub>2</sub>VER wants to demonstrate the feasibility of more efficient biotechnological processes for the capture and conversion of CO<sub>2</sub> from industrial point sources into the valuable platform chemicals isobutene and lactate.

To do so, the BioRECO<sub>2</sub>VER team will investigate among others a hybrid enzymatic process for CO<sub>2</sub> capture from industrial point sources. The conversion of captured CO<sub>2</sub> into the target products isobutene and lactate will be realized through 3 proprietary microbial platforms which are representative of a much wider range of products and applications. Bioprocess development and optimization will occur with both fermentative and bioelectrochemical systems. The microbial platforms will be advanced to Technology Readiness Level (TRL) 4 and the most promising process for each target product will be validated at TRL 5 on real off-gases.

## International consortium combines industrial experience and academic expertise

The BioRECO<sub>2</sub>VER project was launched in January 1<sup>st</sup> and will run until the end of 2021 on a 7 mio EUR budget. The project will be coordinated by VITO (Flemish Institute for Technological Research). The other project partners are EnobraQ (France), Technical University of Luleå (Sweden), Syngip (Netherlands), IDENER (Optimización Orientada a la Sostenibilidad - Spain), CNR (Consiglio Nazionale delle Ricerche – Italy), Universitat de Girona (Spain), NOVA (Institut für politische und ökologische Innovation GmbH – Germany), Cementos Portland Valderrivas (Spain), Arkema (France), PKN ORLEN (Polski Koncern Naftowy ORLEN S.A. – Poland), and NatureWorks LLC (USA).

nova-Institute is a private and independent research institute, founded in 1994; nova offers research and consultancy with a focus on bio-based and CO<sub>2</sub>-based economy in the fields of food and feedstock, techno-economic evaluation, markets, sustainability, dissemination, B2B communication and policy. Every year, nova organises several large conferences on these topics; nova-Institute has 30 employees and an annual turnover of more than 3 million €.
